P19	**खिड़की खोलो**	*khidki kholo*	Open the window
P20	**चादर ठीक करो**	*chaadar theek karo*	Fix the blanket

> **Before the first session — mirror test P08 against P11.**
> मुझे ठंड लग रही है and मुझे नींद आ रही है are the same length, open with मुझे and close with रही है. Mouth both silently in front of a mirror. If you cannot tell them apart, neither can the model — swap one now. After collection starts the list is frozen.

> **Clip length is 3 seconds — the same on every phone.**
> Confirm P12, सांस लेने में तकलीफ, fits comfortably when mouthed at a natural, unhurried pace. Every clip must be the same length, because that length becomes the tensor size the model trains on. Changing it mid-collection splits the corpus in two.

WHY THESE PHRASES

Chosen for what a bedbound person without a voice actually needs, and for visual distinctness on the lips. Sounds made with the lips closed — /p/, /b/, /m/ — look identical to a camera, so the set deliberately varies in length and opening shape rather than relying on consonant contrasts the model cannot see. P15 and P17 are very short, P12 is long: that spread is itself a signal the model gets for free.
